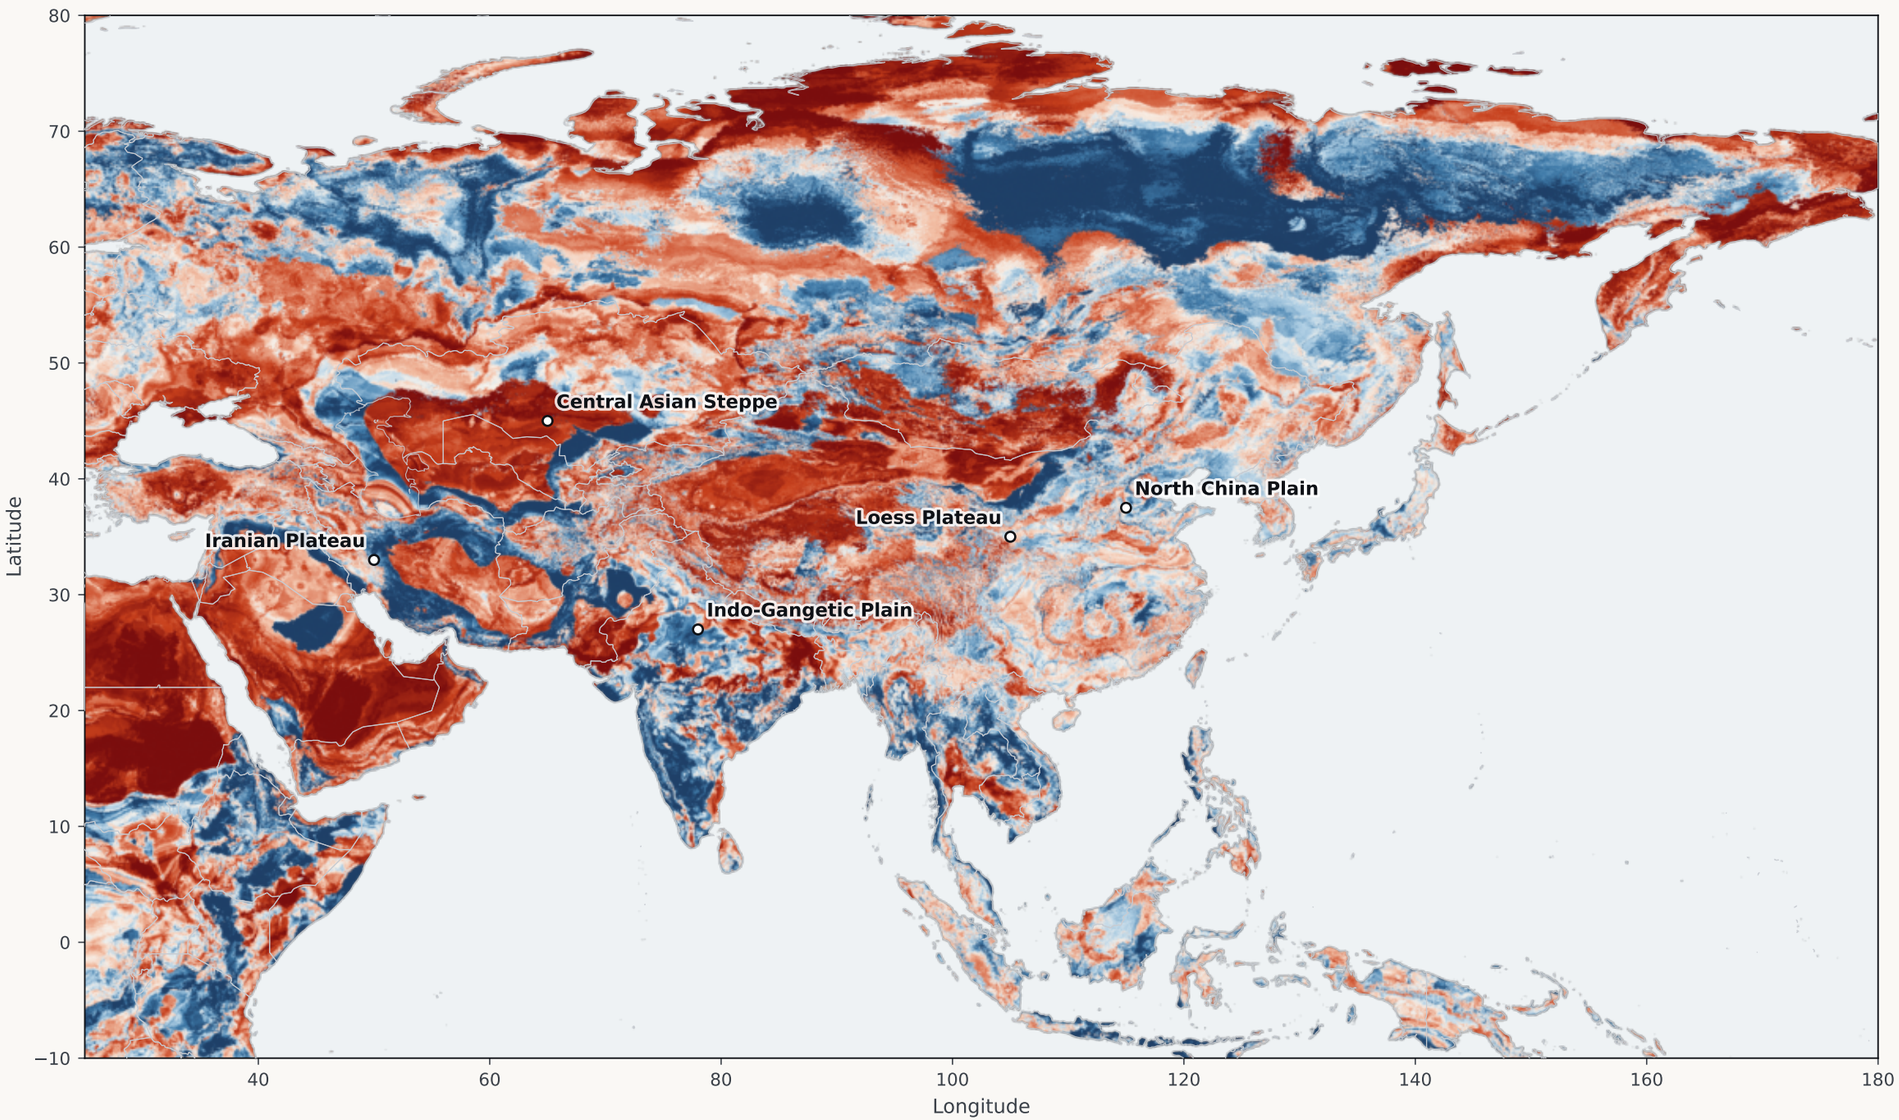
Climate-Corrected Soil Microbial Respiration Anomaly

Predicted soil respiration ÷ climate-expected soil respiration. Values below 1.0 indicate microbial activity is suppressed relative to what climate alone would support — a signal of soil-driven degradation.
Climate-feature model — transfers to held-out US sites



ANOMALY RATIO

INTERPRETATION

≥ 1.25	Microbial activity exceeds climate expectation
1.00 – 1.25	Healthy / functioning soils
≈ 1.00	At climate expectation
0.75 – 1.00	Mild suppression
≤ 0.75	Significant degradation — addressable by management
